

The temperature test, outside 15°C, San Salvador is 400 metres above Felanitx on the island of Mallorca.

There is the monastery in the distance

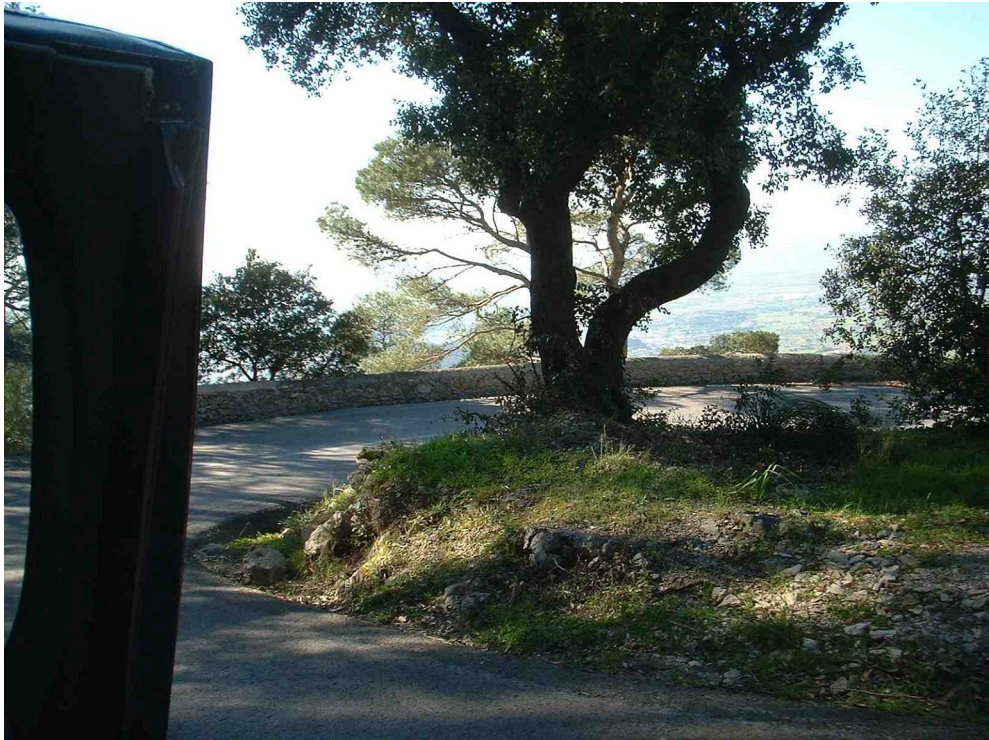

Here we are at the top.

Still on the top with Porto Colom in the background

Note temperature guage and oil pressure

On the down only as photos on the way up a trifle dangerous

a few tight bends

another

and another.

Started with guage reading 60°, 1.5 km of relatively moderate incline and sweeping curves, then 2.5 km of double back bends.

Arrived at top having been in 2nd gear for 2.5 km with temperature about 78°, radiator cap just warm. This is after 2+ months of continually flushing the cooling system via the block with this cable tie fully inserted freeing unlimited amounts of rust particles, probably a jam jar full from the block!
